

The Open Source Software Boot Camp For Librarians, Software Developers and Information Scientists (Library Power Tools Book 1)

Originally an essay in a doctoral intellectual property law class, this book on open source software licensing is the guide for the librarian short on time and in need of solutions. Using the Mozilla software license agreement as an example, computer and library and information science professor Nicholas Arthur Prieve explains when it makes sense to use open source software solutions in libraries or other environments and when it does not. Copyright law has changed substantially over the last 10 years and costs of software licenses have gone up with costs of compliance. Understanding the basics and being able to apply it to library policies and purchasing, this is an excellent book for library science students or library managers. The first edition covers the different types of software licenses, the open source agreement, basic contract law and build a strategy for what to look for in a software license.
