This volume describes the morphology of the primate retina as seen with the electron microscope. As it is an atlas, the electron micrographs are its most important part. The text accompanies the figures, highlighting selected topics either to explain structures or to point out structure-function relationships. A scholarly review of the whole spectrum of research on the retina and choroid is not feasible in a single volume. Thus, whenever available, review articles or monographs, rather than original work, are cited for reference.
